

I'm not robot!

According to Delux Chen, a flat-panel industry analyst from the Photonics Industry and Technology Development Association (PIDA), a non-profit organization working with private enterprises and government agencies to increase the competitiveness of Taiwan's optoelectronics industry, a see-through display has been around for a decade or two, but only this year is it emerging to be incorporated into consumer products like handheld devices, televisions, and other technology because it can be used for augmented reality, a way of enhancing people's view of the world with digital images overlaid onto real ones, and other applications such as shopping displays and more sophisticated computer screens.

Other than mobile phones and watches, the transparent display has several potential uses. For example, it can be used in shopping windows that show the latest store information while simultaneously

allowing consumers to see products through the display. It can also be used in games and slot machines because it can be eye-catching. For vending machines, this may be the largest potential market because they allow for digital signage without loss of customer-facing area on the vending machine. In addition, it can be used on refrigerator to function as digital signage that discloses the food inside while show menus, recipes, health information, or ordering information outside.

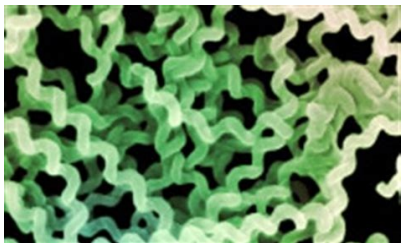

A display on the rise?

The other market research firm Displaybank forecasted that after transparent display hit the market last year, pushing demand for windows, automobile panels and building-integrated advertising, it will likely create an \$87.2 billion market by 2025. According to the report released by Displaybank, the next-generation

Bacteria of spiral (helical) shape Spiral bacteria, bacteria of spiral (helical) shape, form the third major morphological category of prokaryotes along with the rod-shaped bacilli and round cocci.[1][2] Spiral bacteria can be subclassified by the number of twists per cell, cell thickness, cell flexibility, and motility. The two types of spiral cells are spirillum and spirochete, with spirillum being rigid with external flagella, and spirochetes being with internal flagella.[3] Spirillum Campylobacter jejuni is a common pathogen of bacterial food-related gastrointestinal illness. A spirillum (plural spirilla) is a rigid spiral bacterium that is Gram-negative and frequently has external amphitrichous or lophotrichous flagella.[3] Examples include: Members of the genus Spirillum Campylobacter species, such as Campylobacter jejuni, a foodborne pathogen that causes campylobacteriosis Helicobacter species, such as Helicobacter pylori, a cause of peptic ulcers Spirochetes Thin spirochete Treponema pallidum bacteria, the causative agent of syphilis magnified 400 times. A spirochete (plural spirochetes) is a very thin, elongate, flexible, spiral bacteria that is motile via internal periplasmic flagella inside the outer membrane.[3] They comprise the phylum Spirochaetes. Owing to their morphological properties, spirochetes are difficult to Gram-stain but may be visualized using dark field microscopy or Warthin-Starry stain.[4] Examples include: Leptospira species, which cause leptospirosis. Borrelia species, such as Borrelia burgdorferi, a tick-borne bacterium that causes Lyme disease Treponema species, such as Treponema pallidum, subspecies of which causes treponematoses, including syphilis References ^ Csuros, Maria; Csuros, Csaba (1999).
